Musical Energies

Just as a body deprived of nourishment succumbs to fatigue, illness, and ultimately death, a mind starved of vitality weakens. While food fuels the body, music revitalizes the mind. Music's inherent rhythmic patterns can harmonize with our often chaotic mental states, fostering rejuvenation.

To amplify our life energy, we must cultivate expansive, positive perspectives that transcend self-interest. Practices such as pranayama, coupled with mindful engagement with music, can align us with a deeper reality—a unified whole of which we are all part.

Across traditions, including yoga and shamanism, the key to abundant energy lies in affirming our connection to its source. Unlike material wealth, which yields returns through hoarding, energy flourishes through distribution. Acts of love and compassion, though requiring more energy than hatred, are profoundly restorative. While nutrition is vital, it's not the sole source of energy. Yoga emphasizes the transformative power of kriyas and aims to tap into the fundamental source of existence.

Faith and energy are intrinsically linked. Music cultivates faith by shifting our focus from self-centeredness to universal connection, fostering confidence and the ability to radiate positive energy. When we have unwavering faith in our endeavors, such as creating music, our energy levels soar. Greater faith fuels stronger willpower, which in turn amplifies energy flow.

Music, acting as a non-verbal affirmation (which can be enhanced with words), cultivates a habit of positive affirmation through regular exposure. By concentrating on positive attributes, we promote well-being and cheerfulness, influencing those around us positively.

These processes strengthen our inner resilience. Music serves as a catalyst, addressing our internal conflicts, building faith, dismantling negativity, and reinforcing bonds of love and community. This ensures a sustained flow of energy, benefiting both ourselves and those we share our journey with.

Trance and Musical Silence

The silences woven into music can be likened to the experience of trance. In Nada yoga, this state is recognized as anahata, the 'unstruck sound,' a state of consciousness characterized by a diminished awareness of external stimuli.

As trance is a natural phenomenon, akin to sleeping and waking, it poses no inherent risk. There is no danger of becoming 'lost' or 'trapped' within a trance state.

The Pro-trance Sounds

Sounds that facilitate a relaxing trance state are inherently imbued with qualities of love and compassion. Gentle, low-decibel tones, particularly those enriched with harmonic overtones, can significantly enhance relaxation. Ideally, these should be soothing tones or proto-ragas that do not engage the analytical mind. Once the mind becomes actively involved in listening, the state of relaxation is disrupted. The mind may even begin to question the quality and origin of the sounds, hindering the intended effect.

Therefore, when selecting relaxing tones or proto-ragas, the aim is to avoid stimulating the mind. Instead, the mind should be gently subdued through the repetition of monotones, encouraging acceptance rather than inquiry.

Effective trance-inducing sounds are characterized by simplicity and a sense of mystery, similar to the sounds produced by Tibetan singing bowls or the ek tara.

Ancient Indian traditions recognized the ability of primitive instruments, such as conch shells and the damaru, to shift consciousness from a state of alertness to a state of deep relaxation.

The Anti-Trance Sounds

Conversely, a chaotic mix of abrupt bleeps, clips, and blips—a noisy amalgamation of fluctuating decibels and irregular rhythms—can disrupt a trance state. In the Ramayana, Kumbhakarna, known for his profound sleep, was awakened by relentless drumbeats and dissonant synthetic tones.

An experiment conducted at Lebenshilfe, an organization supporting 457 children with intellectual disabilities in Visakhapatnam, India, demonstrated that such jarring sound emissions can, at least temporarily, rouse severely affected children from states of deep inactivity.
